

# Server upgrade from version 7.8 to version 8.0.

This guide applies to upgrading from version 7.8 to version 8 server (64-bit), where the databases are hosted on a SQL Server. The 32-bit version follows the same upgrade process.

The upgrade must be performed from the location where the Febdok server was originally installed. You cannot upgrade the Febdok server from a Febdok client. Before starting Febdok after the upgrade, you must upgrade the SQL database. The screenshots in this guide are taken from Windows 10.

To upgrade from version 7.8 to version 8, you need to know whether you are using the 32-bit or 64-bit version. You must use the same type during the upgrade. You cannot upgrade from 32-bit to 64-bit or vice versa.

# NB! Both the server and the clients must be upgraded. It is recommended to uninstall the clients before starting the server upgrade.

Download version 8 from our website: www.febdok.no.

### SQL Upgrade.

Febdok has renamed the product database from "Febdok-Nelforeg" to "Febdok-ProductReg". This means you must transfer the new product database to the SQL Server. If you do not do this and start Febdok, you will receive the following message:

Figure 8 Febdok-ProductReg is missing on the SQL server.
